Task

Regression: Service API return incorrect locations

Add a timesheet

Add a timesheet for this task

Description

Tthe service API is currently broken for me. POSTing to a tracker item like http://tiki.local/api/trackers/1/items/2 succeeds, but redirects me to "Location: item2" which is http://tiki.local/api/trackers/1/items/item2 and doesn't exist.

This partially breaks the kanban board, but probably other things using the api.

I am even more surprised that POSTing to <mark>https://tikicms.test/api/trackers/1/items</mark> is not even working for me....
I have 2 fields and my request body looks like :

```
{
    "fields": {
        "roomtemperaturetrackerTemperatureC": 18,
        "roomtemperaturetrackerTimxxxe": "2020-12-31 22:00"
    }
}
```

but the reponse :

```
{
    "code": 400,
    "errortitle": "Tracker item could not be created.",
    "message": "Tracker item could not be created."
}
```

I have an update
elvis.ansima 2024-03-04 17:29

I was sending the request in a wrong way,
by sending request as formData with field name in brackets eg.
fields [roomtemperaturetrackerTemperatureC] i was able to POST
on <mark>https://tikicms.test/api/trackers/{trackerID}/items/{itemID}</mark>
using postman and the item was edited, i did not see any

redirection in the response header and the api just returned the expected json response.

So @benoit.gregoire how to reproduce this bug ?
