Description
"@" mentions (of individual users, or user groups) is a standard workflow in every modern collaborative web platform that has commenting, reviewing, multi-user editing, etc.

If we want to create a good UX that "works" for Comments UX + Notifications revamp, we should be able to depend on this functionality being there; not a plugin, not an option.

So let's make @ mentions a hard "core" dependency within Tiki, so that it can be consistently used for:

- Tiki tracker fields and descriptions
- Comments
- Wiki page contents (and history)
- Forums
- Anything else that cites users or history, or anything else involving notifications and assignments
