I was able to do some tests. All of them seem to work well. However, I had to reset all data (Remove the volume used by containers) after each test. Just after running docker-compose build, the first test (Testing federation from prejournal to timeld and tikiwiki) passes without problem but when I try to run the second test ( Testing federation from timeld to prejournal and tikiwiki) there is an error, I am forced to delete the data created in the previous test. If I don't do it, only federation to tikiwiki is validated.

I was also able to access web services like tikiwiki (localhost:8180) and mailhog (localhost:8025) but for prejournal (localhost:8280) and timeld-gateway (localhost:8080) I got errors as you can see on these images: [prejournal\\_web\\_service\\_error](#), [timeld-gateway\\_web\\_service\\_error](#).

Apart from these minor issues, I think it's good that all three tests passed:

- federation from prejournal to timeld and tikiwiki
- federation from timeld to prejournal and tikiwiki
- federation from tikiwiki to prejournal and timeld
